and control**

# OUTPOST COLLABORATION

## Why Outpost Collaboration?

We live in a new context and world where remote access and collaboration is assumed, even for sensitive and confidential information.

Outpost Collaboration allows government authorities, municipalities, pharmaceutical companies, organizations responsible for a nation's critical infrastructure and others to collaborate securely and host their own private cloud.

## Who is the user?

Groups that have identified assets to protect but need to collaborate around confidential or sensitive information.

Today's public cloud services have security limitations when a supplier originated from a nation with regulations supporting access to the content in the public cloud. Outpost Collaboration provides all benefits from a public cloud by easy information sharing and effective collaboration in a secure way.

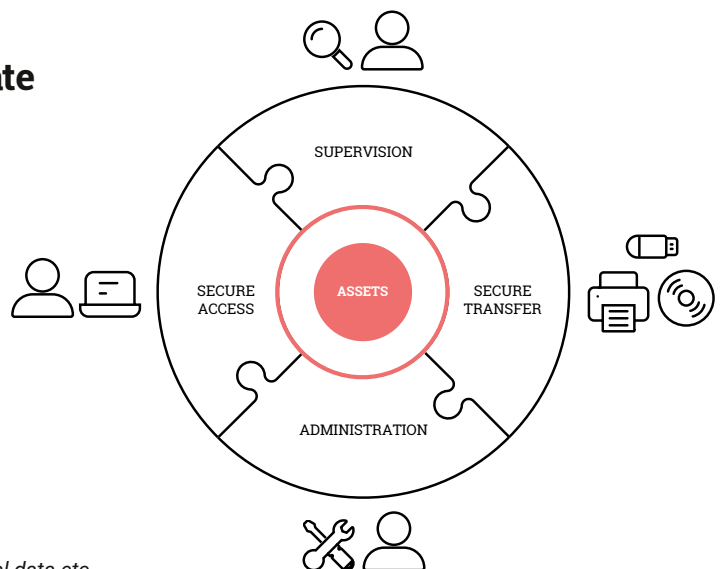

## What can Outpost Collaboration be used for?

Secure internal and external communication in the form of text, image, and video. Just like through a cloud, users can share and edit documents. They can set up private and shared desktops and delegate different levels of access.

## General secure template

### The assets\* are protected by:

- ▶ Secure Access
- ▶ Controlled Administration
